CUSTOMER SHOPPING BEHAVIOUR

# Customer growth matters more than basket size

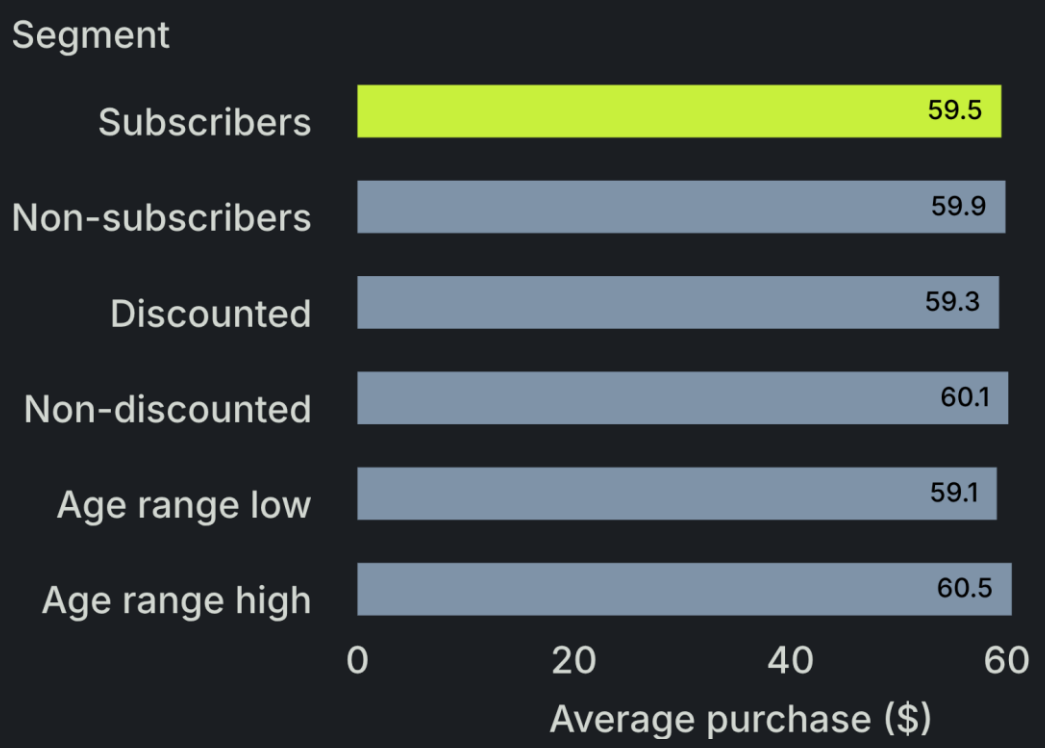

The path to growth is more customers and repeat purchases, not higher basket size.

Made with GAMMA

# Spend stays near $60 across every segment

Average purchase is essentially flat across subscription, discount and age segments.

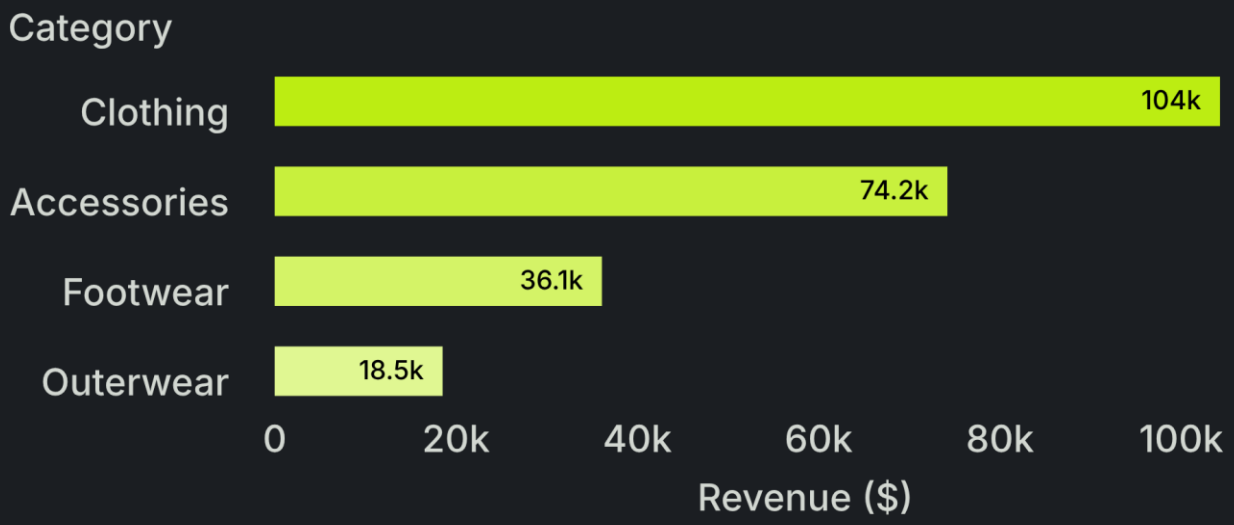

Average purchase: **$59.76** across 3,900 customers.

Made with GAMMA

# Revenue concentration comes from who buys and what they buy

Men are 68% of customers and contribute 67.7% of revenue, but spend almost the same per purchase as women: **$59.54** vs **$60.25**.

The opportunity is to widen the customer base and category reach, not to chase a high-spending segment.

Clothing generates 44.7% of revenue ($104,264), followed by Accessories at 31.8%.

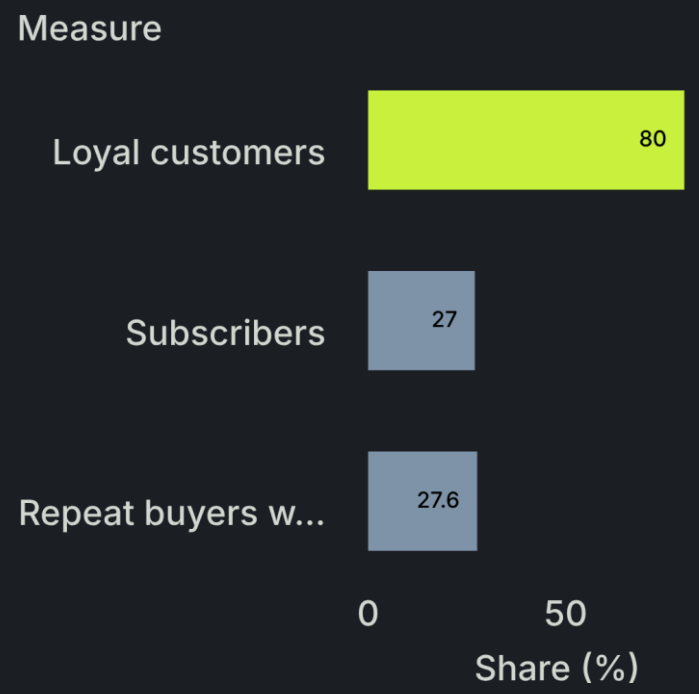

Made with GAMMA

# Loyalty is strong, but subscriptions are under-converted

**3,116 customers**, or **80%**, have more than 10 previous purchases.

Only 27% of customers subscribe, despite every subscriber receiving a discount. Repeat buyers subscribe at 27.6%, barely above the 27.0% overall rate.

The customer base is already loyal, but repeat buying is not converting into subscriptions.

Made with GAMMA

# Broad discounts are expensive without lifting basket size

**43%**

of purchases carry a discount

1,677 of 3,900

**839**

discounted purchases were still above the $59.76 average

50% of discounted purchases

That suggests discounts may be reaching customers who would have spent above average anyway.

Test withholding discounts from a sample and compare spend plus repeat rate.

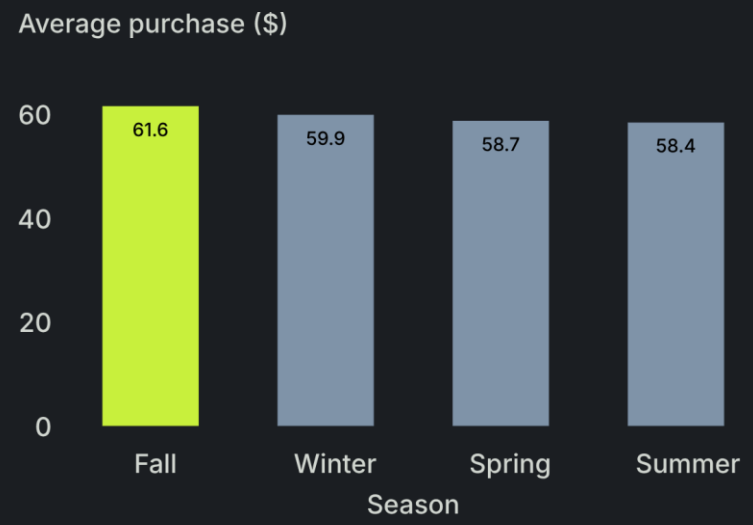

Made with GAMMA

# Seasonality gives promotions a better timing signal

Fall has the highest average purchase at **$61.56** and revenue of **$60,018**. Summer has the lowest average purchase at **$58.41** and revenue of **$55,777**; Spring averages **$58.74**.

Protect margin in Fall; use targeted promotions when average spend is lower.

Outerwear contributes 7.9% of revenue and contains only two products, making it a range-review candidate.

Made with GAMMA

# The method is reusable, but the next dataset needs better business context

01

### Clean and engineer

Clean and engineer the data in Python, including category-median rating imputation and age quartiles.

02

### Store and query

Store one cleaned customer table in PostgreSQL and answer ten business questions with SQL.

03

### Connect and align

Connect Power BI to the same table so KPI cards, charts and slicers agree with the SQL results.

**Current limits:** one purchase per customer, no dates, no sales channel and no cost or margin data.

Made with GAMMA

THE DECISION

# Three actions turn the analysis into growth

## Convert loyalty

Offer subscribers more than a discount, starting with customers who have 10+ previous purchases.

## Target promotions

Run a discount holdout test and measure spend, repeat rate and margin.

## Widen the base

Prioritise female acquisition while protecting the Clothing core and reviewing Outerwear's role.

**Next data ask:** add dates, channels and costs so future decisions can optimise profitability, not just spend.
